

RESISTANCE OF PROTECTIVE CLOTHING TO PENETRATION BY BLOOD-BORNE PATHOGENS

- Does your job involve treating and caring for individuals where you maybe exposed to biological fluids?
- Biological fluids are capable of transmitting diseases which can pose significant risks to life and health. This is especially true of blood-borne viruses which cause Hepatitis and Acquired Immune Deficiency Syndrome (AIDS).
- To reduce the risk of direct skin contact with these blood-borne pathogens, the use of protective clothing which resists the penetration of the pathogens is essential.
- Shirley Technologies Ltd can assess the effectiveness of materials used in protective clothing for protecting the wearer against contact with blood-borne pathogens.
